make both applications as child applications under a parent application  
run these applications as microservices

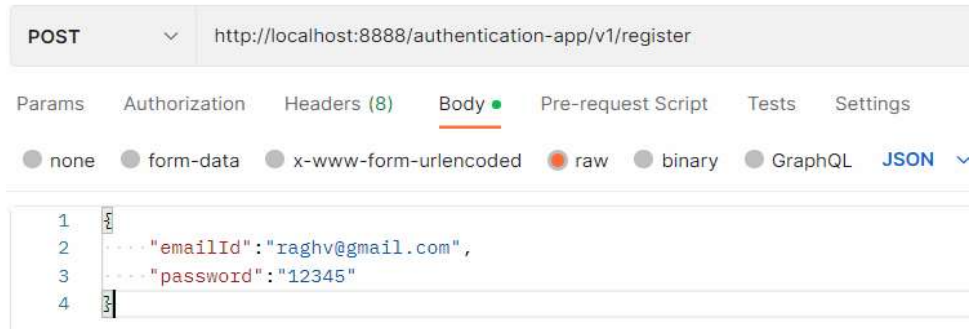

Here, prodcutapplication is parent  
it holds other two applications as child applications  
userproduct  
authentication

### For Step1

Postman/FE / client application needs to send User data according to User model of authentication application

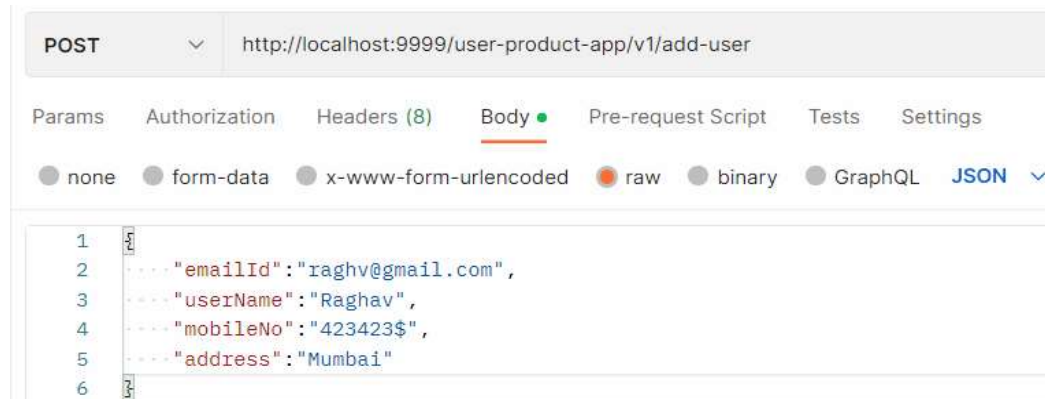

emailid	passed	id	auto
password	passed	role	hardcoded

### For Step 2

Postman/FE / client application needs to send User data according to User model of data application

emailid	passed	mobileNo	passed	prodcuts[ ] empty
userName	passed	address	passed	

For Step3

Postman/FE / client application needs to send login/authentication data

userId

password

The image shows the Postman interface for a POST request. The URL is `http://localhost:8888/authentication-app/v1/authenticate`. The request body is a JSON object with the following structure:

```
{  "userId": 13,  "password": "12345"}
```

The response is a JSON object with the following structure:

```
{  "message": "User successfully logged in",  "token": "eyJhbGciOiJIUzUxMiJ9.eyJ1c2VyT2JqZWNOIjp7InVzZXJJZCI6MTMsInBhc3N3b3JkIjoiiiwicm9sZSI6IlJPTEVfVVNFUiIsImVzcyNjAxfQ.aGqRYaK0g55ensAYDyag2SBejAeYJico8hYrbbDv-sXNdKvdSkRZqpAwDgNhYMTwsJP0s0iCO"}
```

For Step 4 try to access intercepted url/resource of application2  
get user product details

The screenshot displays two sequential REST client requests. The first is a GET request to `http://localhost:9999/user-product-app/v1/get-user-product-details/raghv@gmail.com`. The 'Authorization' tab is active, showing a Bearer Token. The response body, viewed in JSON, contains user details: emailId, userName, mobileNo, address, and an empty products array. The second request is a POST to `http://localhost:9999/user-product-app/v1/add-product-to-user/raghv@gmail.com`. The 'Body' tab is active, showing a JSON object with productname 'diecast car' and category 'toy'. The response body, also in JSON, shows the user details with the new product added to the products array.

**GET Request**

URL: `http://localhost:9999/user-product-app/v1/get-user-product-details/raghv@gmail.com`

Params: Authorization (selected), Headers (7), Body, Pre-request Script, Tests, Settings

Type: Bearer Token (selected) Token: `eyJhbGciOiJIUzUxMiJ9.eyJ1c2VyT2JqZWN...`

The authorization header will be automatically generated when you send the request.

11  ]
12 }
```

Combined data model class  
 DTO model class

Steps to add Feign client in data app to communicate with auth application

Step 1 Make sure both applications ready

Productapp ----> authapp

productapp microservice is calling authapp microservice  
with the help of feignclient tool on productapplication

Step 2 add required dependency in productapp  
feignclient

```
<!-- https://mvnrepository.com/artifact/org.springframework.cloud/spring-cloud-starter-openfeign -->  
<dependency>  
  <groupId>org.springframework.cloud</groupId>  
  <artifactId>spring-cloud-starter-openfeign</artifactId>  
  <version>3.1.3</version>  
</dependency>
```

```

### Step 3 Create proxy interface

Below is the RESTAPI endpoint used to add user in authentication application

part of authentication application, will be called from product application

```
28 // for registering new user
29 // http://localhost:8888/authentication-app/v1/register [POST]
@PostMapping("/register")
public ResponseEntity<?> registerUser(@RequestBody User user){
    user.setRole("ROLE_USER");
    return new ResponseEntity<>(userService.addUser(user), HttpStatus.OK);
}
```

create proxy in productapp for above RESTAPI endpoint

part of product application, thru proxy it can connect to auth application

```
1 UserProxy.java x
2 package com.stackroute.productapp.proxy;
3
4 public interface UserProxy {
5 }
6
```

### Step 4 Create require model classes

CommonUser  
UserDTO

emailId, userName, password, mobileNo, address  
same as authentication user class

id, role  
id, role, emailId, password

```
7 @Data
8 @AllArgsConstructor
9 @NoArgsConstructor
10 public class CommonUser {
11     private String userName, emailId, password, mobileNo, address;
12 }
13
```

```
7 @Data
8 @AllArgsConstructor
9 @NoArgsConstructor
10 public class UserDTO {
11     private int userId;
12     private String emailId, password, role;
13 }
```

Step 5 Modify controller to capture commonUser type of data in signup request

```
19 // to add user
20 // http://localhost:9999/user-product-app/v1/add-user [POST]
21 @PostMapping("/add-user1")
22 public ResponseEntity<?> addUser1(@RequestBody CommonUser commonUser){
23     return new ResponseEntity<>(userService.addUser1(commonUser), HttpStatus.OK);
24 }
```

Step 6 modify service layer

```
12 @Service
13 public class UserProductServiceImpl implements UserProductService{
14     // 4 usages
15     @Autowired
16     private UserProductRepository userProductRepository;
17
18     @Override
19     public User addUser1(CommonUser commonUser) {
20         // keep logic to separate user data for data application
21         // for auth application
22         // send auth user data to auth application thru proxy
23     }
```

Step 7 Goback to proxy interface

Note: makesure auth application has name property configured

```
9 spring.application.name=authentication-service
```

```
9 @FeignClient(name="authentication-service",url="localhost:8888")
10 public interface UserProxy {
11     @PostMapping("/authentication-app/v1/register")
12     public ResponseEntity<?> sendUserObjectToAuthApp(@RequestBody UserDTO userDTO);
13 }
```

## Step 8 Modiy service layer

define logic to add data application user data into mongo

to send auth application user data to auth application

```
23      @Override
24      public User addUser1(CommonUser commonUser) {
25          // keep logic to seperate user data for data application
26          // for auth application
27          // send auth user data to auth application thru proxy
28          // commonUser has data application user data, auth application user data
29          // get only data application user details -> repository
30
31          // create dto object, fill data from commonuser object
32          UserDTO userDto = new UserDTO();
33          userDto.setEmailId(commonUser.getEmailId());
34          userDto.setPassword(commonUser.getPassword());
35          ResponseEntity<?> response = userProxy.sendUserObjectToAuthApp(userDto);
36          // above line is for connecting with another microservice using Feign client
37          System.out.println(response);
38          // create data application user object, fill details from common user object
39          User user = new User(commonUser.getEmailId(), commonUser.getUserName(),
40                              commonUser.getMobileNo(), commonUser.getAddress(), new ArrayList());
41          return userProductRepository.insert(user);    }
42
```

## Step 9 Enable feignclient on application

```
10      1 usage
11      @SpringBootApplication
12      @EnableFeignClients
13      public class ProductappApplication {
14
15      public static void main(String[] args
16
17
```

## How to test run application

**POST** ▼ `http://localhost:9999/user-product-app/v1/add-user1`

Params Authorization ● Headers (9) **Body** ● Pre-request Script Tests Settings

● none ● form-data ● x-www-form-urlencoded ● raw ● binary ● GraphQL **JSON** ▼

```
1 {
2   "userName": "aditya",
3   "emailId": "aditya@gmail.com",
4   "password": "12345",
5   "mobileNo": "1234567890",
6   "address": "pune"
7 }
```

**Body** Cookies Headers (5) Test Results 🌐 Status: 200 OK

Pretty Raw Preview Visualize **JSON** ▼ ↺

```
1 {
2   "emailId": "aditya@gmail.com",
3   "userName": "aditya",
4   "mobileNo": "1234567890",
5   "address": "pune",
6   "products": []
7 }
```

Makesure, user record inserted in both DBs

in auth db

userid	auto
emailId	passed
password	passed
role	hard coded

in product data db

emailId	passed
userName	passed
mobileNo	passed
address	passed
